

AGILE MOBILE APP

A personal, touchless elevator experience for tenants

AGILE Mobile lets tenants operate your elevators using their smartphone or wearable. This new amenity is simple to use and takes your building sophistication — and its convenience — to the next level. No more touching public elevator buttons or screens.

To save time while providing a personalized elevator experience, users can set a “home” floor Autolift service in their profile, and the app will automatically offer rides to this destination. That means an elevator can be pre-called for tenants, saving them time and making their transit seamless.

Easy operation

When tenants are near your elevators, the AGILE Mobile app identifies their floor and prompts them to select an elevator destination. After selecting their destination, our intelligent AGILE dispatching system determines which elevator to ride, and advises the tenant through the app. To save time while providing a personalized elevator experience, tenants can add a “home” floor to their profile, and the app automatically offers rides to this destination.

Simple tenant enrollment and management

Tenants download AGILE Mobile from app stores and request enrollment. An intuitive building administration portal allows your building management to administer user requests individually or in batch uploads. The portal can integrate with most access control companies to synchronize permissions. In addition, your building management can use the portal to create tenant groups and floor access schedules.

Features and benefits

- Promotes confidence in your building safety while helping provide a cleaner environment
- Helps reduce germ spread within buildings
- Easy integration on both Destination and Traditional dispatching systems for all 32-bit controllers
- Easy installation with access control and scheduling services
- Simple administration portal for managing users and monitoring the system
- Home floor auto-prompting provides a personalized and convenient building amenity
- Available on Android and iOS devices, and compatible wearables
- Secure and safe cloud delivery provides the latest security and feature updates
- End-to-end encryption and two-factor authentication for data security
